Scalable Automatic Machine Learning with H2O

SF Big Data Science Meetup
Sept 2018

Erin LeDell Ph.D.
@ledell

What is H2O?

H2O.ai, the company

- Founded in 2012
- Advised by Stanford Professors Hastie, Tibshirani & Boyd
- Headquarters: Mountain View, California, USA

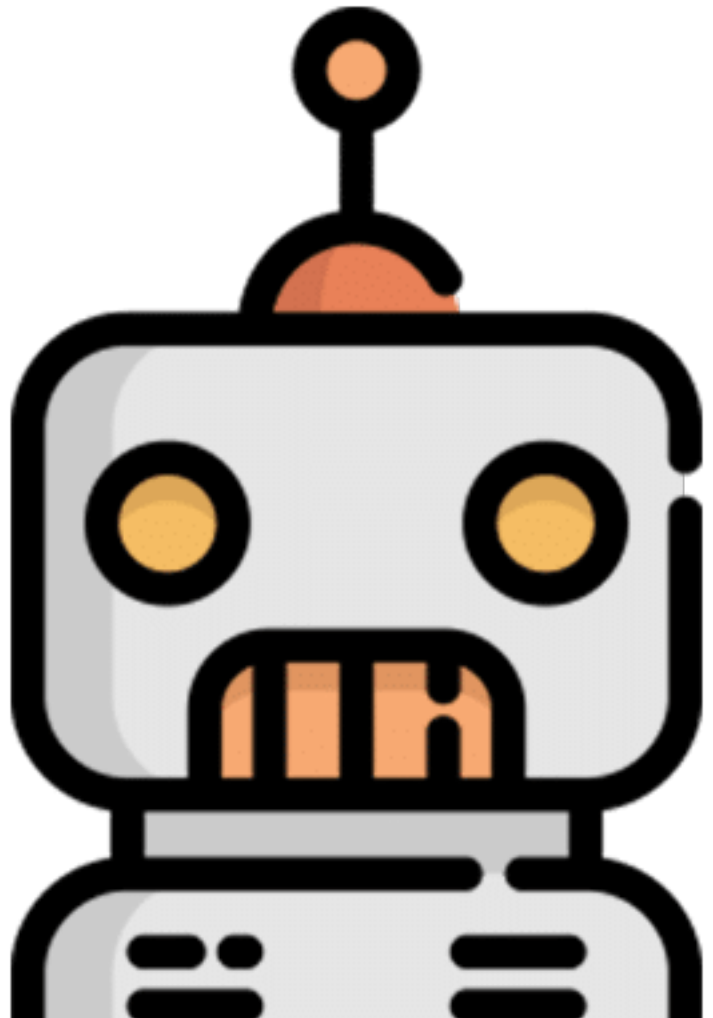
H2O, the platform

- Open Source Software (Apache 2.0 Licensed)
- R, Python, Scala, Java and Web Interfaces
- Distributed Machine Learning Algorithms for Big Data

Agenda

- H2O Platform
- Intro to Automatic Machine Learning (AutoML)
- H2O AutoML Overview
- Pro Tips
- Demo

Slides ⬇️ https://tinyurl.com/sfbds-automl



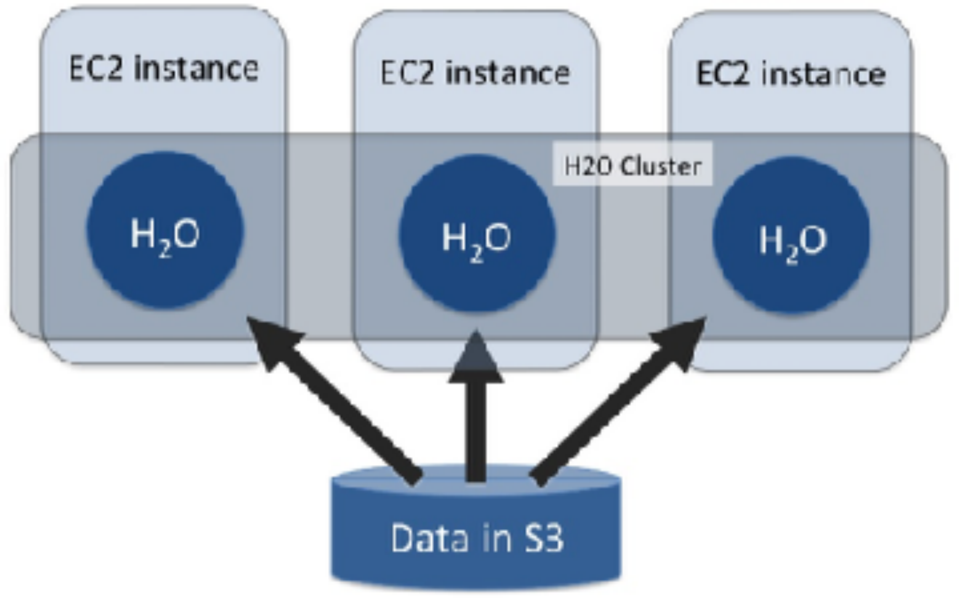
H2O Platform

H2O Machine Learning Platform

- Distributed (multi-core + multi-node) implementations of cutting edge ML algorithms.
- Core algorithms written in high performance Java.
- APIs available in R, Python, Scala; web GUI.
- Easily deploy models to production as pure Java code.
- Works on Hadoop, Spark, EC2, your laptop, etc.

H2O Distributed Computing

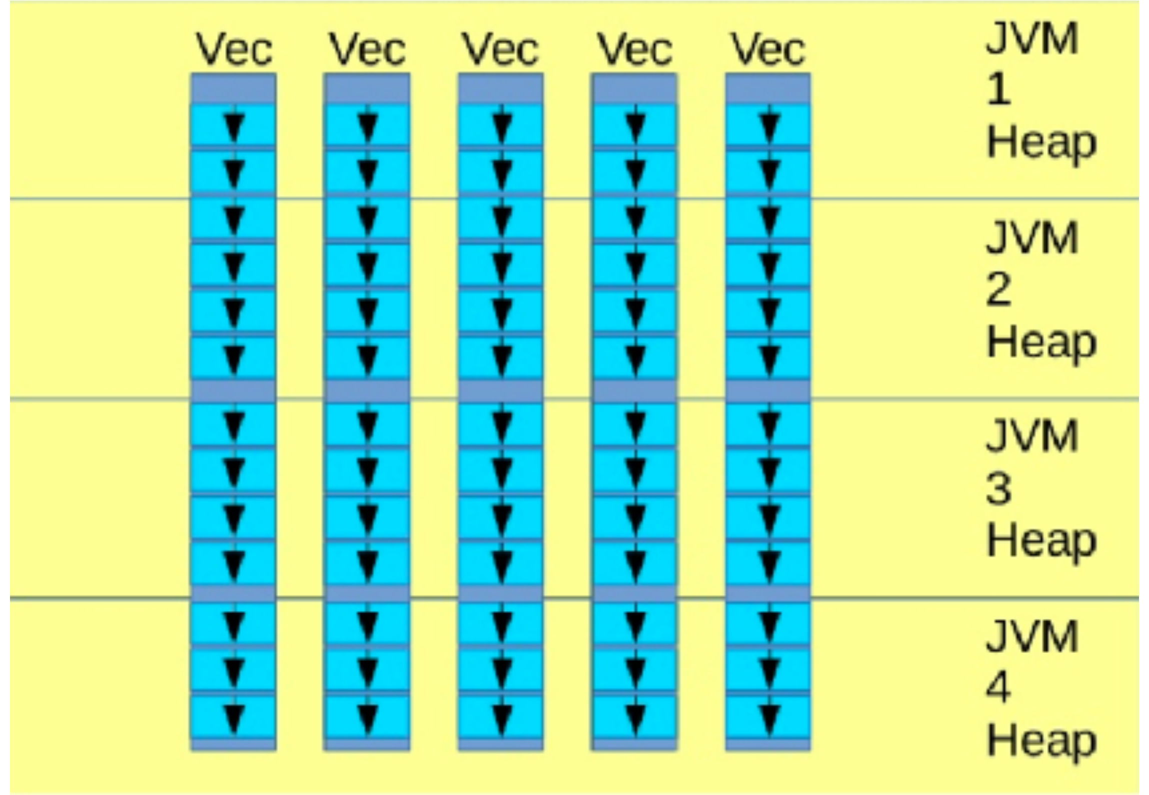
H2O Cluster



- Multi-node cluster with shared memory model.
- All computations in memory.
- Each node sees only some rows of the data.
- No limit on cluster size.

H2O Frame

- Distributed data frames (collection of vectors).
- Columns are distributed (across nodes) arrays.
- Works just like R's data.frame or Python Pandas DataFrame



H2O Machine Learning Features

- Supervised & unsupervised machine learning algos (GBM, RF, DNN, GLM, Stacked Ensembles, etc.)
- Imputation, normalization & auto one-hot-encoding
- Automatic early stopping
- Cross-validation, grid search & random search
- Variable importance, model evaluation metrics, plots

Intro to Automatic Machine Learning

Aspects of Automatic Machine Learning

Data Prep

Model Generation

Ensembles

Aspects of Automatic Machine Learning

Data Preprocessing

- Imputation, one-hot encoding, standardization
- Feature selection and/or feature extraction (e.g. PCA)
- Count/Label/Target encoding of categorical features

Model Generation

- Cartesian grid search or random grid search
- Bayesian Hyperparameter Optimization
- Individual models can be tuned using a validation set

Ensembles

- Ensembles often out-perform individual models
- Stacking / Super Learning (Wolpert, Breiman)
- Ensemble Selection (Caruana)

H2O's AutoML

H2O AutoML (current release)

Data Preprocessing

- Imputation, one-hot encoding, standardization
- Feature selection and/or feature extraction (e.g. PCA)
- Count/Label/Target encoding of categorical features

Model Generation

- Cartesian grid search or random grid search
- Bayesian Hyperparameter Optimization
- Individual models can be tuned using a validation set

Ensembles

- Ensembles often out-perform individual models:
- Stacking / Super Learning (Wolpert, Breiman)
- Ensemble Selection (Caruana)

Random Grid Search & Stacking

- Random Grid Search combined with Stacked Ensembles is a powerful combination.

- Ensembles perform particularly well if the models they are based on (1) are individually strong, and (2) make uncorrelated errors.

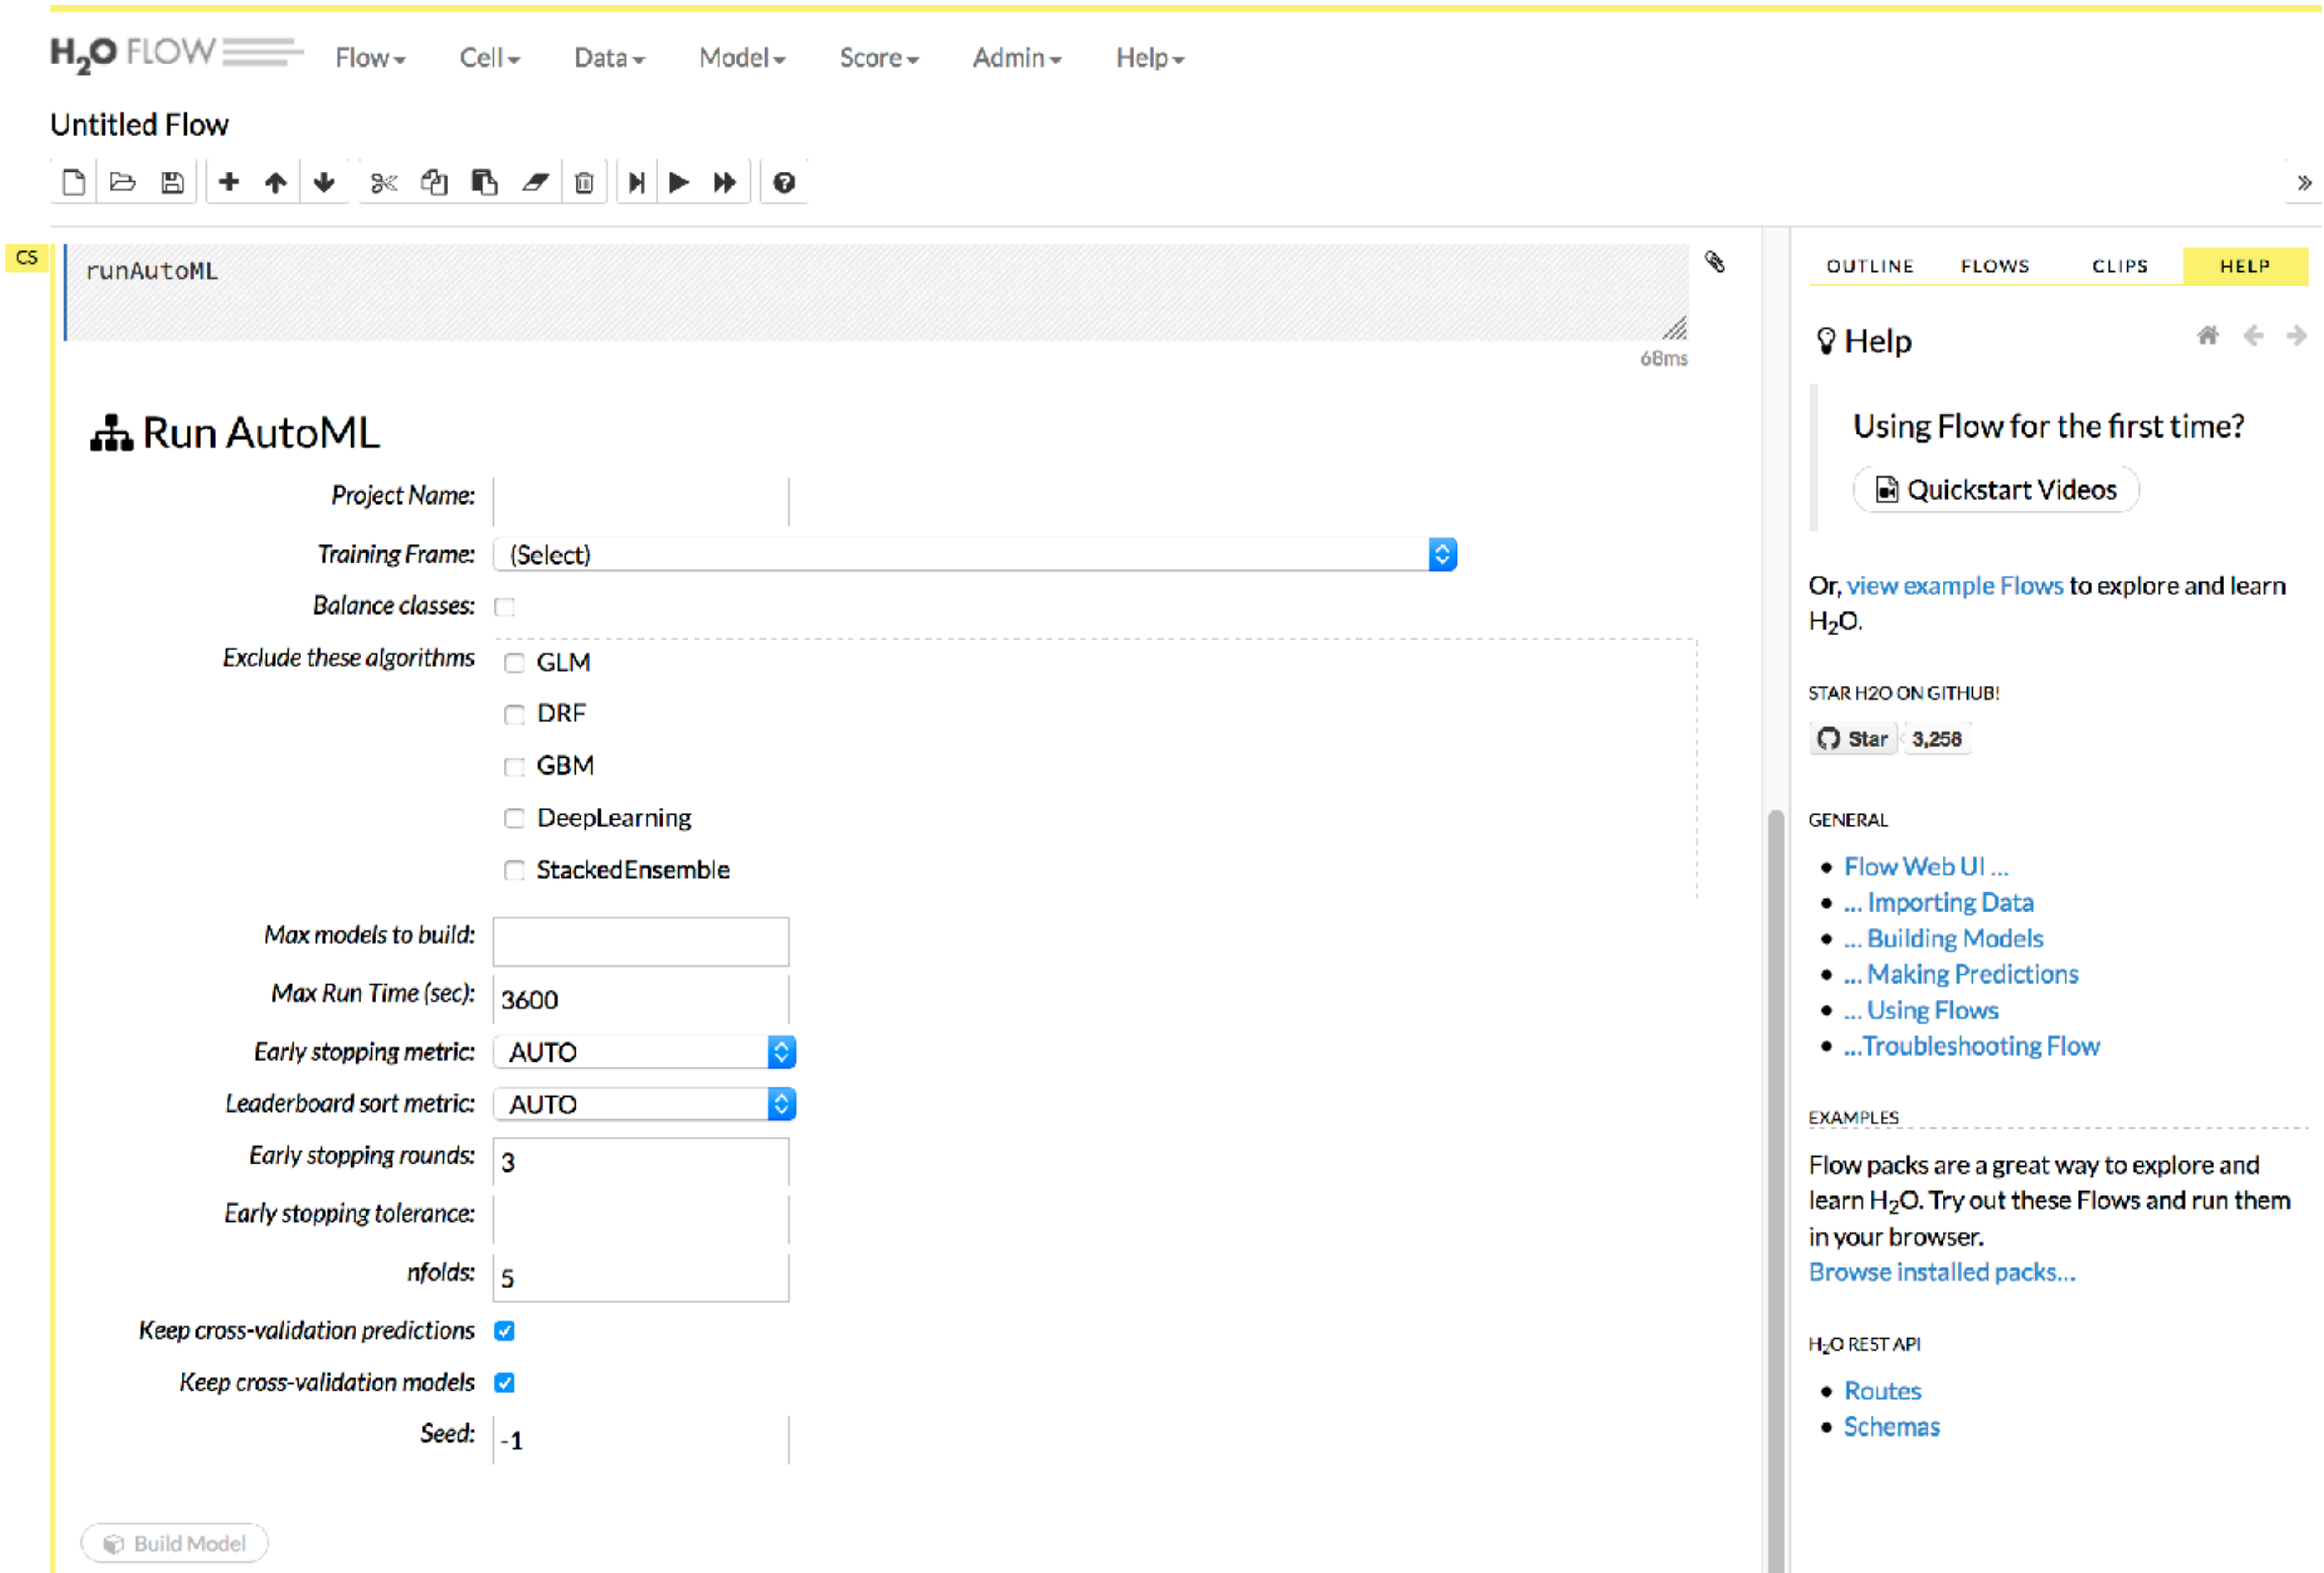
- Stacking uses a second-level metalearning algorithm to find the optimal combination of base learners.

H2O AutoML

- Basic data pre-processing (as in all H2O algos).
- Trains a random grid of GBMs, DNNs, GLMs, etc. using a carefully chosen hyper-parameter space
- Individual models are tuned using a validation set.
- Two Stacked Ensembles are trained (“All Models” ensemble & a lightweight “Best of Family” ensemble).
- Returns a sorted “Leaderboard” of all models.

Available in H2O >=3.14

H2O AutoML in Flow GUI



```
runAutoML
```

Run AutoML

Project Name:	
Training Frame:	(Select)
Balance classes:	☐
Exclude these algorithms	☐ GLM ☐ DRF ☐ GBM ☐ DeepLearning ☐ StackedEnsemble
Max models to build:	
Max Run Time (sec):	3600
Early stopping metric:	AUTO
Leaderboard sort metric:	AUTO
Early stopping rounds:	3
Early stopping tolerance:	
nfolds:	5
Keep cross-validation predictions	☑
Keep cross-validation models	☑
Seed:	-1

H2O AutoML in R

Example

```
library(h2o)

h2o.init()

train <- h2o.importFile("train.csv")

aml <- h2o.automl(y = "response_colname",
                  training_frame = train,
                  max_runtime_secs = 600)

lb <- aml@leaderboard
```

H2O AutoML in Python

Example

```python
import h2o

from h2o.automl import H2OAutoML

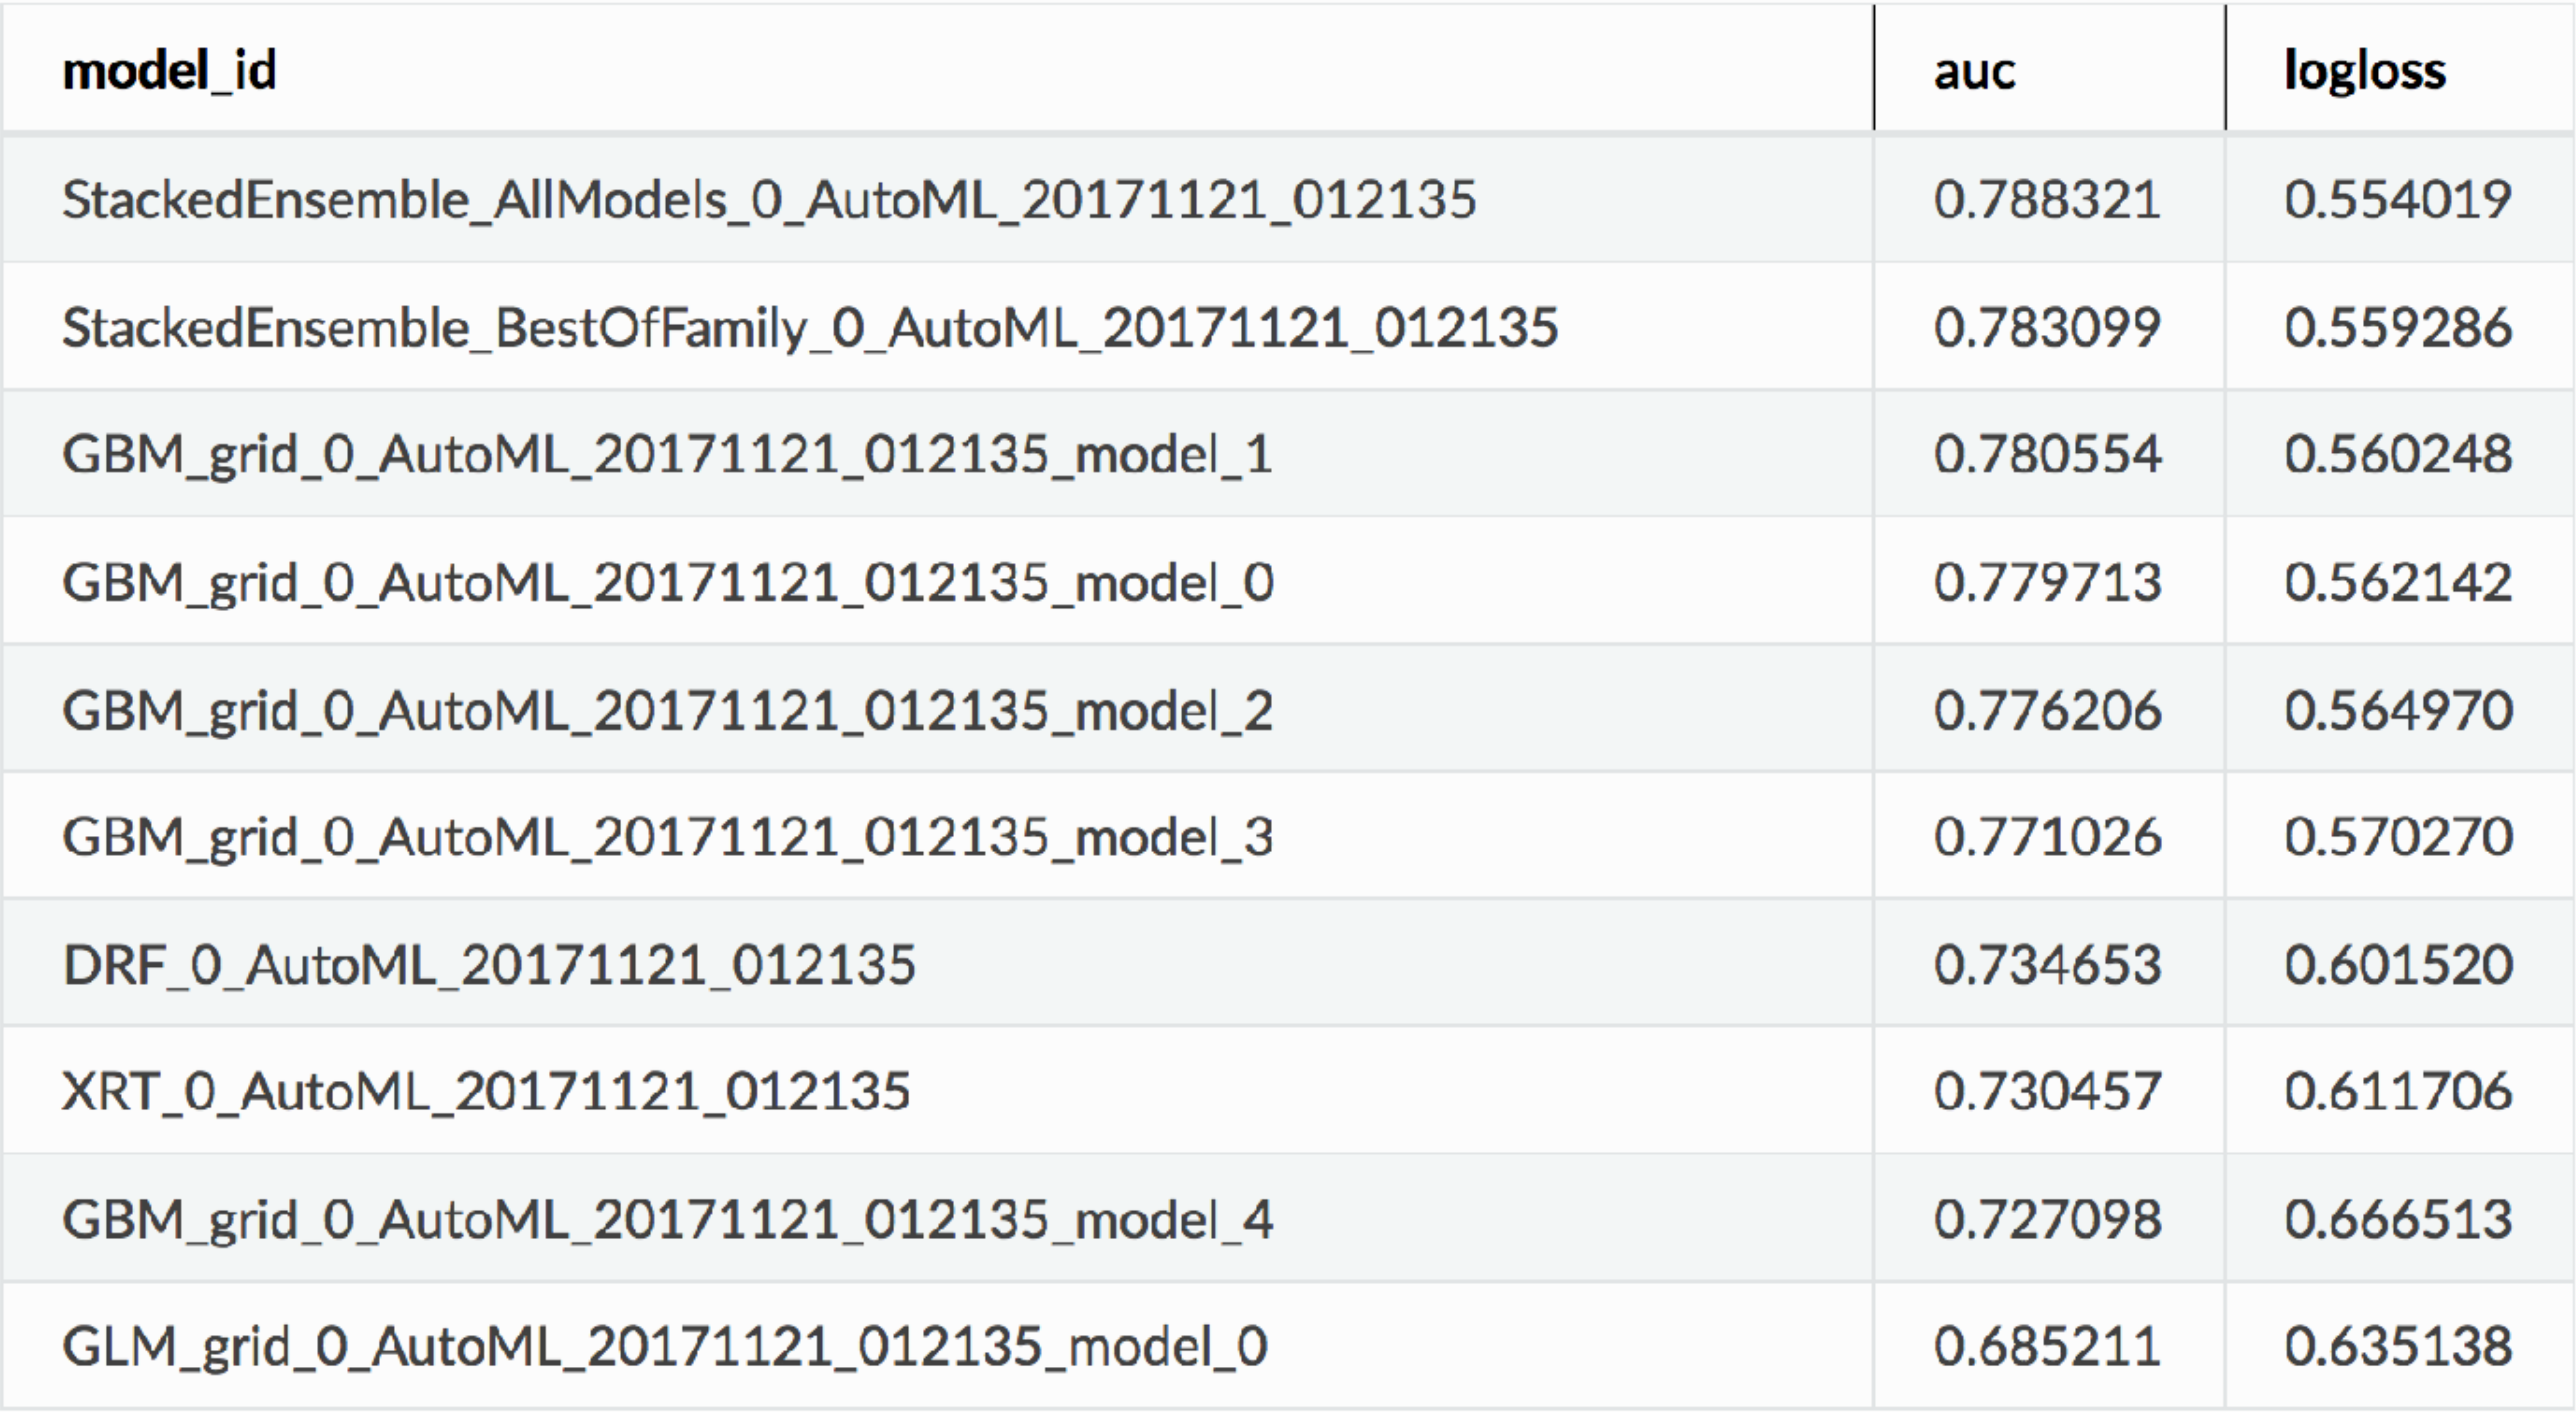
h2o.init()

train = h2o.import_file("train.csv")

aml = H2OAutoML(max_runtime_secs = 600)
aml.train(y = "response_colname",
          training_frame = train)

lb = aml.leaderboard
```

H2O AutoML Leaderboard



model_id	auc	logloss
StackedEnsemble_AllModels_0_AutoML_20171121_012135	0.788321	0.554019
StackedEnsemble_BestOfFamily_0_AutoML_20171121_012135	0.783099	0.559286
GBM_grid_0_AutoML_20171121_012135_model_1	0.780554	0.560248
GBM_grid_0_AutoML_20171121_012135_model_0	0.779713	0.562142
GBM_grid_0_AutoML_20171121_012135_model_2	0.776206	0.564970
GBM_grid_0_AutoML_20171121_012135_model_3	0.771026	0.570270

XRT_0_AutoML_20171121_012135	0.730457	0.611706
GBM_grid_0_AutoML_20171121_012135_model_4	0.727098	0.666513
GLM_grid_0_AutoML_20171121_012135_model_0	0.685211	0.635138

Example Leaderboard for binary classification

AutoML Pro Tips!

Before you press the “red button”

AutoML Pro Tips: Input Frames

- Don’t use `leaderboard_frame` unless you really need to; use cross-validation metrics to generate the leaderboard instead (default).

- If you only provide `training_frame`, it will chop off 20% of your data for a validation set to be used in early stopping. To control this proportion, you can split the data yourself and pass a `validation_frame` manually.

AutoML Pro Tips: Exclude Algos

- If you have sparse, wide data (e.g. text), use the `exclude_algos` argument to turn off the tree-based models (GBM, RF).
- If you want tree-based algos only, turn off GLM and DNNs via `exclude_algos`.

AutoML Pro Tips: Time & Model Limits

- AutoML will stop after 1 hour unless you change `max_runtime_secs`.
- Running with `max_runtime_secs` is not reproducible since available resources on a machine may change from run to run. Set `max_runtime_secs` to a big number (e.g. 999999999) and use `max_models` instead.

AutoML Pro Tips: Cluster memory

- Reminder: All H2O models are stored in H2O Cluster memory.
- Make sure to give the H2O Cluster a lot of memory if you’re going to create hundreds or thousands of models.
- e.g. `h2o.init(max_mem_size = “80G”)`

After you press the “red button”

AutoML Pro Tips: Early Stopping

- If you're expecting more models than are listed in the leaderboard, or the run is stopping earlier than `max_runtime_secs`, this is a result of the default "early stopping" settings.
- To allow more time, increase the number of `stopping_rounds` and/or decrease value of `stopping_tolerance`.

AutoML Pro Tips: Add More Models

- If you want to add (train) more models to an existing AutoML project, just make sure to use the same training set and `project_name`.
- If you set the same seed twice it will give you identical models as the first run (not useful), so change the seed or leave it unset.

AutoML Pro Tips: Saving Models

- You can save any of the individual models created by the AutoML run. The model ids are listed in the leaderboard.

- If you're taking your leader model (probably a Stacked Ensemble) to production, we'd recommend using "Best of Family" since it only contains 5 models and gets most of the performance of the "All Models" ensemble.
